Wantace assignment

PART A: REAL BUSINESS AUDIT

1. Business Overview

Type of Business: Tailoring Unit

Business Category: Tailoring, Custom Stitching, and Clothing Alterations

Interview Method: In-person interview in Telugu

Person Interviewed: Business Owner

Average Orders: Approximately 5 orders per day

Customer Type: Men, women, and children

The selected business is a local tailoring unit that provides stitching services for men's, women's, and children's clothing, along with clothing alterations. Customers generally visit the shop in person to discuss their requirements, provide measurements, and place orders.

The business owner is responsible for managing customer inquiries, coordinating the stitching process, monitoring order progress, and handling deliveries and payments. The business receives approximately five orders per day, with most of its daily activities managed through personal experience, memory, and a few written notes.

2. Interview Summary

An in-person interview was conducted with the tailoring-unit owner in Telugu to understand the daily operations, order-management process, and challenges faced by the business.

The interview covered how customers place orders, how measurements are collected, how materials are arranged, how stitching is completed, and how orders are checked and delivered.

The owner explained that most orders are managed manually. Customer requirements and order details are remembered or recorded in a few notes rather than maintained in a centralized tracking system.

One of the major challenges identified during the interview was the shortage of skilled workers for hand embroidery and blouse work. This shortage affects the stitching schedule and can delay customer deliveries by approximately one day.

Key findings from the interview

- The business handles approximately five orders per day.
- Customers primarily place orders through walk-in visits.
- The unit provides stitching and alteration services for men, women, and children.
- The owner takes responsibility for coordinating the overall workflow.
- Order details are managed mainly through memory and a few written notes.
- A shortage of skilled workers for blouse handwork and related stitching tasks creates delays.
- Some orders require an additional day for delivery because of the worker shortage.

Direct quotes from the owner

Quote 1 — Skilled-worker shortage:

“Chetikutilu, blouse work cheyataniki sariyan panivallu takkuva.”

English translation: “There are not enough skilled workers to do handwork and blouse work.”

Quote 2 — Impact on delivery:

“Danivalana kasta time adjust cheytaniki ibbandhi eduravutundhi.”

English translation: “Because of that, it becomes difficult to adjust the time and manage the schedule.”

Note: The English translations convey the intended meaning of the owner's Telugu statements. Retain the original wording as accurately as possible.

3. Existing Business Process Map

The following process represents the order workflow described by the owner.

Customer inquiry → Measurements → Material procurement → Stitching → Quality checking → Delivery and payment

Step-by-step process

1. **Customer inquiry:** The customer visits the shop and explains the required garment or alteration.
2. **Measurements:** The owner collects the customer's measurements and understands the design and stitching requirements.
3. **Material procurement:** The required fabric or other materials are purchased or arranged.
4. **Stitching:** The garment is stitched according to the customer's requirements. Certain blouse designs may require specialized handwork.
5. **Quality checking:** The completed garment is checked before delivery.
6. **Delivery and payment:** The garment is handed over to the customer, and payment is handled.

Process-map attachment: Include a hand-drawn version of this workflow in the final submission, reflecting the process discussed during the interview.

4. Audit Observations

Observation 1: Manual order management

The business relies mainly on the owner's memory and a few written notes to manage customer orders. This approach may become difficult when several orders have different measurements, designs, and delivery dates.

Observation 2: Dependence on skilled workers

Some stitching tasks, especially blouse handwork, require specialized skills. The shortage of workers with these skills creates a bottleneck in the production process.

Observation 3: Delivery-schedule difficulties

When skilled workers are unavailable, the owner has difficulty adjusting the schedule. As a result, some orders may take approximately one additional day to complete and deliver.

Observation 4: Owner-dependent operations

The owner is responsible for coordinating most stages of the workflow. This creates a dependence on the owner's ability to remember order details, monitor progress, and coordinate the available workers.

5. Main Problem Identified

The primary operational challenge identified during the audit is the **shortage of skilled workers for blouse handwork and related specialized stitching tasks**.

This shortage affects the tailoring unit's ability to complete certain orders within the expected timeframe. The difficulty is increased by the manual approach to order management, which relies on memory and limited written records.

The business therefore faces two related operational concerns:

- Availability of skilled workers for specialized stitching.
- Managing order progress and delivery schedules when delays occur.

6. Initial Opportunity for Improvement

Based on the interview, the business could benefit from a simple order-tracking method that records customer requirements, measurements, order status, and expected delivery dates.

A basic tracking system could help the owner identify pending orders, monitor progress, and communicate delivery updates to customers. However, order tracking alone would not solve the shortage of skilled workers; that issue would require a separate operational response.

Any proposed improvement should be practical, affordable, and suitable for a small tailoring business.

7. Supporting Evidence

The following evidence should accompany this audit in the final submission:

1. **Interview evidence:** Details of the in-person interview, including the actual date and duration.
2. **Owner's statements:** The two direct Telugu quotes documented above.
3. **Process map:** A hand-drawn diagram showing the existing order workflow.
4. **Business photographs:** At least two photographs collected with the owner's permission.
5. **Audit notes:** Observations about order management, skilled-worker availability, and delivery delays.

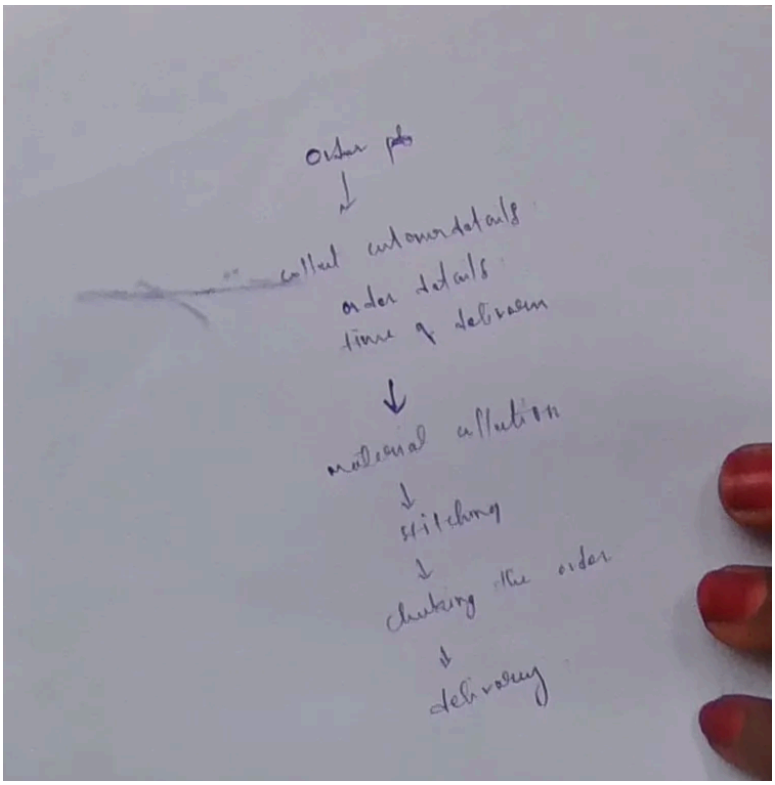

8. Conclusion

The audit provided an understanding of the tailoring unit's daily operations and the challenges involved in managing customer orders. The business follows a straightforward workflow from customer inquiry to final delivery, but relies heavily on the owner's experience and manual record-keeping.

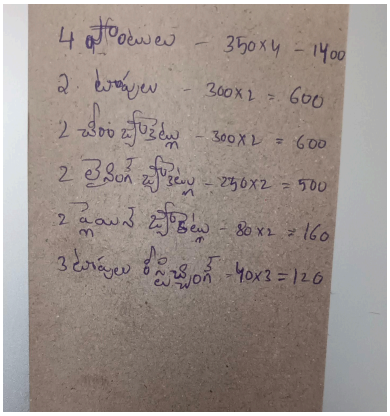

The shortage of skilled workers for blouse handwork was identified as the main operational bottleneck, resulting in scheduling difficulties and occasional delivery delays. Improving order visibility and tracking could support day-to-day coordination, while the skilled-worker shortage remains a separate challenge requiring further consideration.

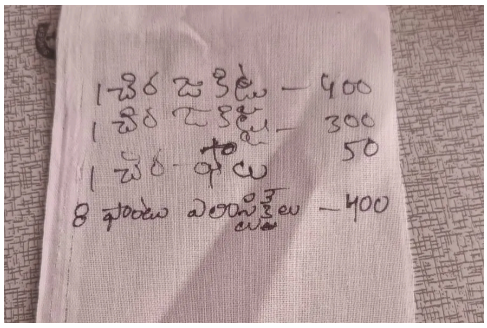

This audit establishes a practical foundation for identifying improvements that suit the business's actual needs and operating conditions.

PART B — REQUIREMENT DOCUMENT

Vardhan Steelware | Order Visibility and Operational Tracking

Document purpose: Define a practical Phase 1 system that gives management clear order-status visibility and improves tracking of dispatches, payment holds, and outsourced polishing.

1. Problem Statement — In the Client's Words

Vardhan Steelware manufactures stainless steel utensils and serves approximately 40 distributors across North India. The business has around 70 employees and recently started online sales.

The primary problem is limited visibility into order progress. Suresh cannot independently identify where an order is delayed and must contact Ramesh, whose diary contains operational updates.

Suresh explained: **“Problem orders ki nahi hai. Problem yeh hai ki pata nahi chalta maal kahan atka hai.”** (The problem is not the number of orders; it is not knowing where the goods are stuck.)

He also stated: **“Mujhe bas phone pe dekhna hai kaunsa order kahan hai.”** (I just want to see on my phone where each order stands.)

Kunal prefers a modern system with marketplace integrations and AI-based sales forecasting. However, the immediate requirement is a reliable, easy-to-use order-tracking system that addresses the operational visibility gap.

2. Evidence and Data Quality Findings

The order sheet dated 1–7 September 2026 and the “Vardhan Dispatch” WhatsApp export reveal the following issues.

Finding	Evidence	Required handling
Potential duplicate order	Gupta Traders' 200-piece Kadai No. 10 order appears as both dispatched and pending at ₹185 per piece on 1 September.	Flag for verification; do not automatically merge or delete.
Repeated order entry	Jain Crockery's 150-piece Kadhai No. 10 order at ₹192 per piece appears on 2 and 4 September; the second entry says it was sent again on WhatsApp.	Confirm whether it is a new order or a repeated message.
Missing customer	A 20-dozen Thali 12-inch order at ₹600 per dozen has no party name.	Require customer identification before confirmation.
Missing rate	Verma Utensils has a pending 180 kg Kadhai order with no rate.	Keep the rate pending and flag the order for confirmation.
Payment hold	Sharma Bartan Bhandar has a 30-dozen Gilas order held against ₹1.8 lakh in old dues; a later Patila set order is also on hold.	Display the hold reason and require authorised release.
Partial dispatch	Mehra Kitchenware ordered 300 Kadai pieces; 180 were dispatched and the remaining 120 were recorded as pending polishing, then dispatched on 6 September.	Track ordered, dispatched and remaining quantities separately.
Return recorded as negative quantity	Sharma's damaged-goods return is entered as −6 dozen.	Record a return transaction with reason and reference to the original order.
Polishing reconciliation gap	WhatsApp records 420 kg sent to Pappu, 1,180 pieces returned and a reported 6 kg shortage.	Track each batch and reconcile comparable units before accepting the discrepancy.

Interpretation: These records show inconsistent statuses, incomplete fields and weak traceability. Repeated entries may be duplicate messages or legitimate separate transactions; verification is necessary before correction.

The evidence also challenges some client statements:

- **Order volume:** Suresh estimates 60–70 orders monthly, while Kunal says there are more. Confirm the actual volume.
- **Payment issues:** Suresh says payments are not a problem, but the order sheet shows explicit payment holds and ₹1.8 lakh in old dues.
- **Steel discrepancy:** Kunal reports a historical 3–4% difference, while Suresh considers it wastage. The records do not establish the cause.
- **Online sales:** Kunal reports 30% monthly growth, but Suresh says online sales account for less than 5% of the business. The baseline and period need clarification.

3. Current Process Map (As-Is)

Customer enquiry (phone/WhatsApp)

↓

Kunal records the order in Google Sheets

↓

Production prepares the utensils

↓

Goods are sent to external polishing contractors

↓

Returned goods are counted and quantities reconciled by operations/accounts

↓

Goods are packed and dispatch is recorded by Ramesh

↓

Accounts tracks payments and payment-related holds through Munshi ji/Tally

↓

Customer receives the goods

Current visibility gap: Order information is spread across Kunal's sheet, Ramesh's diary, WhatsApp messages and accounts records. The exact ownership of each status update and the complete payment-release workflow must be confirmed.

4. Proposed Phase 1 Scope

In scope

1. Central order register with a unique order ID and customer reference.
2. Order creation, editing with an audit trail, and status tracking.
3. Required-field and data-consistency validation.
4. Status stages: New, In Production, Sent for Polishing, Returned from Polishing, Ready for Dispatch, Partially Dispatched, Dispatched, and On Hold.
5. Partial dispatches and returns recorded as separate transactions.
6. Polishing batch tracking, including quantity sent, quantity received, unit, contractor, date and shortage reason.
7. Payment-hold visibility and authorised hold-release recording.
8. Mobile-friendly order search and dashboard for Suresh.
9. Exception alerts for missing information, overdue orders and unresolved quantity differences.

Out of scope initially

- AI-based sales forecasting: reliable historical data must be established first.
- Full Amazon/Flipkart integration: online sales are currently a small share of the business; validate the need before building integrations.
- Full ERP replacement or migration of every business function.
- Automated accounting or inventory reconciliation with Tally until the required integration and existing workflows are confirmed.
- Automatic classification of every discrepancy as theft, wastage or loss without evidence.

Rationale: Start with order visibility and operational traceability. A focused mobile-first workflow reduces complexity and supports adoption after the previous ERP failed.

5. Data Model

Entity	Key fields and purpose
Customer	Customer ID, name, location, contact, payment status
Order	Order ID, customer ID, order date, source, expected date, current status, hold reason
Order Item	Item ID, order ID, product, quantity, unit, rate, ordered amount
Production/Polishing Batch	Batch ID, order-item ID, contractor, quantity sent, unit, date sent, quantity received, date received, discrepancy and reason
Dispatch	Dispatch ID, order ID, item ID, quantity dispatched, date, delivery reference
Return	Return ID, original order/dispatch ID, quantity, reason, date, resolution status
Payment/Hold	Record ID, customer ID, related order, amount due, hold reason, release status, authorised by
Status History	Record ID, order ID, previous status, new status, updated by, timestamp, remarks

Relationships: One customer can have multiple orders. One order can contain multiple items, polishing batches, dispatches and returns. Status history records every important change.

Validation rules

- Assign a unique ID to every order; flag potential duplicates using customer, product, quantity, date and rate.
- Require a customer, product, quantity, unit and order date before an order is confirmed.
- Do not allow a missing or unconfirmed rate to be treated as final.
- Prevent accidental negative order quantities; record returns separately.

- Prevent dispatched quantity from exceeding the confirmed order quantity unless an authorised amendment exists.
- Track partial dispatches until the outstanding quantity reaches zero or the order is formally closed.
- Do not mark an order as dispatched while a required dispatch record is missing.
- Require an authorised user and reason to release a payment hold.
- Do not compare kilograms directly with pieces without an agreed conversion or item-specific reconciliation method.
- Preserve the original record and maintain an audit trail for corrections.

6. Users and Permissions

User	Mobile view and permitted actions
Suresh — Owner	View all orders, delayed stages, payment holds, partial dispatches and unresolved exceptions. Approve authorised hold releases and important changes.
Kunal — Order coordinator	Create orders, manage customer details, correct records with an audit trail, and monitor order progress.
Ramesh — Dispatch in-charge	View assigned orders, update operational stages, record dispatch quantities and flag incomplete or delayed work.
Munshi ji — Accounts	View payment status, flag dues and holds, verify returns, and reconcile polishing records.
Polishing contractors	No initial login required. Consider restricted access only after confirming whether direct contractor updates are practical.

Access should follow role-based permissions. Shop-floor and dispatch users should have minimal data entry requirements, with clear status options and timestamps.

7. Three Morning Reports for Suresh

Report 1 — Orders Pending by Stage

- Order ID, customer, product and outstanding quantity.

- Current stage, expected delivery date and days delayed.
- Responsible person and latest update.

Report 2 — Orders on Hold or Requiring Action

- Payment holds, missing customer/rate information and unverified duplicate records.
- Pending approvals, hold reasons and responsible user.
- Orders awaiting action and time since the last update.

Report 3 — Polishing and Dispatch Reconciliation

- Quantity and unit sent to each contractor.
- Quantity received, quantity pending and reported discrepancies.
- Partial dispatch quantities, returns and unresolved reconciliation issues.

8. Questions for the Next Client Call

1. **Suresh:** What are the most important order stages and which information must be visible on your phone?
2. **Suresh:** Who has final authority to place orders on hold and release them?
3. **Kunal:** Which sheet is the master record, and how are repeated WhatsApp orders distinguished from new orders?
4. **Kunal:** What does “30% online growth” mean, and what is the current online order volume?
5. **Ramesh:** Can you walk us through one order from production to dispatch, including partial dispatches and delays?
6. **Ramesh:** Which status updates can be entered on a phone without interrupting dispatch work?
7. **Munshi ji:** How are payment holds, old dues, returns and credit adjustments recorded in Tally?
8. **Munshi ji:** How is polishing material reconciled when the quantities use different units, such as kilograms and pieces?

9. **Suresh and Kunal:** Which features are essential before Diwali, and who will participate in testing the first version?
10. **All relevant users:** Why was the 2023 ERP not adopted, and what would make the new workflow simple enough for regular use?

9. Biggest Risk and Mitigation

Biggest risk: Low user adoption.

The previous ERP cost ₹1.2 lakh and was used for only three months; Ramesh and the polishing workers did not use it, and Suresh found it too complicated.

Mitigation plan:

- Design a mobile-first interface with simple

PART C — ACCOUNT EXECUTIVE HANDOFF NOTE

Client: Vardhan Steelware

Prepared for: Wantace Solutions Account Executive

Purpose: Prepare for the next client conversation and move toward a practical Phase 1 agreement.

1. Stakeholders and Decision-Making

- **Suresh Vardhan — Economic buyer and final decision-maker:** Owner who signs cheques. Prioritise operational visibility, simplicity, trust and a clear business benefit.
- **Kunal Vardhan — Influencer and internal champion:** Maintains the order sheet and wants AI forecasting, a modern dashboard and marketplace integrations. Involve him in requirements and scope decisions.
- **Ramesh — Primary operational user:** Dispatch in-charge with 22 years of experience. His adoption is critical because order-status information currently depends on his diary and updates.

- **Munshi ji — Accounts stakeholder:** Uses Tally and handles accounting-related information. Involve him in validating payment holds, returns and reconciliation requirements.

2. Real Pain and Supporting Evidence

The core pain is **lack of reliable, centralised order-status visibility**, not simply the absence of an AI dashboard.

Suresh cannot readily see where goods are stuck and depends on Ramesh for updates. The order sheet and WhatsApp records show repeated order entries, missing customer/rate details, partial dispatches, payment holds and a polishing discrepancy involving 420 kg sent, 1,180 pieces received and a reported 6 kg shortage.

These findings support the need for better order tracking and exception handling. They do not, by themselves, establish the cause of the polishing discrepancy or confirm every apparent duplicate.

3. What the Client Wants vs. What They Need

Client asks for	Underlying need
AI sales forecasting	Reliable, structured historical order data before forecasting is introduced.
Marketplace integrations	Accurate order capture and visibility across sales channels, if online volume justifies integration.
A modern dashboard	A simple, mobile-friendly view of order status, delays and outstanding actions.
Better material reconciliation	Batch-level tracking with consistent units, recorded quantities and investigation of discrepancies.

Recommended positioning: Lead with a simple order-visibility solution. Present forecasting and integrations as potential later phases, subject to validated requirements.

4. Likely Objections and Suggested Responses

Objection 1: “We already tried an ERP, and nobody used it.”

Response: “We understand that adoption is the main concern. We propose starting with a small mobile-friendly workflow and testing it with the people who handle orders and dispatch every day before expanding it.”

Objection 2: “Why can't we build the AI dashboard and integrations immediately?”

Response: “Those features may be valuable, but reliable reporting depends on accurate order data. Let's first establish consistent tracking, then assess which integrations and forecasting capabilities will provide measurable value.”

Objection 3: “Will this create extra work for Ramesh and the factory team?”

Response: “That is a key risk we will test during the pilot. We should keep status updates short, minimise duplicate entry and validate the workflow with Ramesh before wider rollout.”

Objection 4: “Can the system identify exactly where material is being lost?”

Response: “It can help record quantities sent and received, flag discrepancies and preserve an audit trail. Identifying the cause requires consistent measurement and reconciliation; the system should not automatically assume theft or wastage.”

5. Recommended Next Step and Timeline

Next step: Schedule a 30–45-minute discovery and workflow-validation call with Suresh, Kunal, Ramesh and Munshi ji, or the relevant representatives.

Proposed agenda:

1. Confirm the current order-to-dispatch process and master data source.
2. Validate duplicate entries, partial dispatches, payment holds and polishing reconciliation.
3. Agree on the minimum Phase 1 features and user permissions.
4. Identify pilot users, success measures and the process for collecting feedback.

Suggested timeline to discuss, not promise:

- **Week 1:** Validate workflows, data fields and requirements.
- **Week 2:** Prepare a simple prototype and test it with representative users.

- **Weeks 3–4:** If approved, implement and pilot the agreed core workflow, subject to data readiness and technical feasibility.

Do not commit to delivery dates or commercial terms before the technical scope, dependencies and effort are confirmed.

AE takeaway: Sell the outcome—*Suresh can see where each order stands without repeatedly calling Ramesh*—rather than selling AI features. The immediate opportunity is a focused, adoptable order-tracking solution that earns users' trust before the business expands its digital capabilities.

```
# PART D — MARKETING CONTENT

## 1. LinkedIn Post
**Target audience:** Small manufacturing and factory owners
**Topic:** The hidden cost of poor order visibility

A factory can be busy all day and still struggle to answer on
e simple question:

**“Where exactly is this order stuck?”**

During a conversation with a local tailoring business owner,
I learned how a shortage of skilled workers can delay deliver
ies and make scheduling difficult.

This highlighted an important lesson: operational problems ar
e not always caused by a lack of effort. Sometimes, businesse
s need better visibility into their daily work.

When order details, pending tasks and delivery schedules depe
nd heavily on memory, even a small delay can affect the entir
e workflow.
```

```
Three simple questions every business owner should be able to answer:

- Which orders are still pending?
- What is causing the delay?
- Which orders need attention today?

Digital transformation does not always have to begin with an expensive ERP or complex AI system. Sometimes, it starts with a simple, reliable way to track work.

**Better visibility. Better decisions. Smoother operations.**
